Wellhead Oil Recovery

Medium and high-end wellhead equipment and manifolds

This product is mainly used in natural gas injection condition of gas storage to meet the needs of gas injection and other production and operation functions.

Product Features

Independent gas injection and production channels formed by optimizing the wellhead structure

Monitoring wellhead pressure and temperature, and realizing automatic safety control through surface safety valve and underground safety valve

Designed with the functions of connecting the well killing, blowout and testing pipelines

Higher reliability and operability ensured through low torque of gate valve and metal-to-metal sealing

The all-metal sealed device is suitable for working in conditions of high pressure, corrosion and other harsh conditions

Stable and reliable in long-term use, with a long service life

Realize automatic safety control through surface safety valve and underground safety valve

With the functions of connecting the well killing, blowout and testing pipelines

The all-metal sealed device is suitable for working in conditions of high pressure, corrosion and other harsh conditions.
